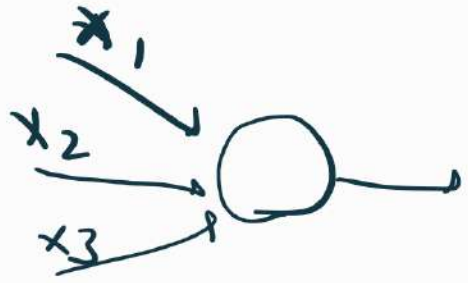
* Modified

- Goodwill hunting (movie) → Good Movie

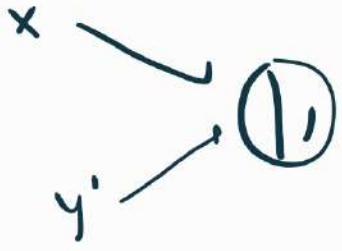


Tell neuron send signal

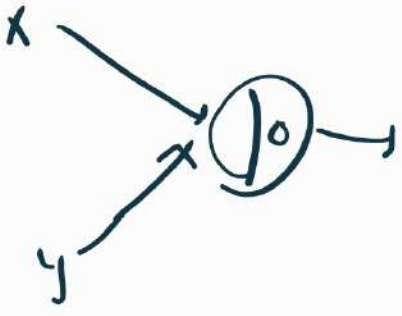
$$f(x) = 1\left(\sum_i x_i \geq \theta\right)$$

- Inputs can be excitatory or inhibitory
- when inh. input is 1 o/p → 0 → stop neuron sending signal
- count no. of 'ON' signal on the excitatory i

XY'



NOR



inhibitory inputs" refer to signals that decrease the likelihood of a neuron firing, while "excitatory inputs" are signals that increase the likelihood of a neuron firing

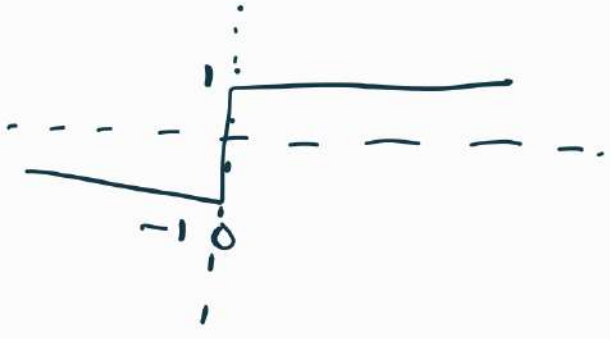
* Perceptron.

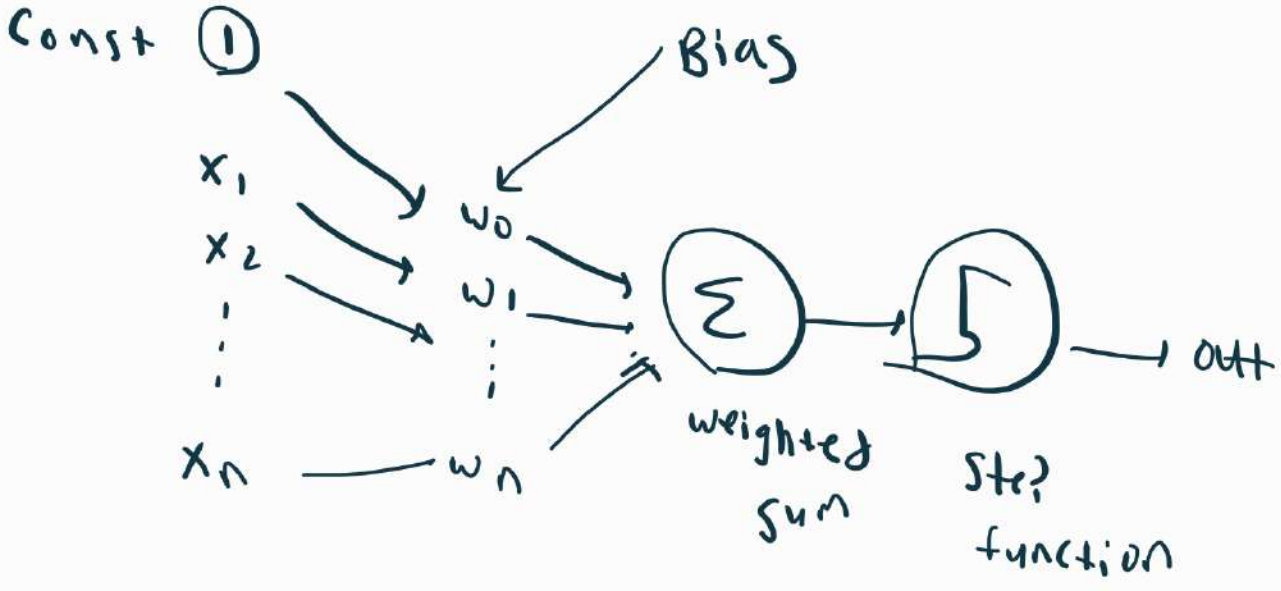
Inputs can be real, weights can be diff. for diff. i/p components.

$$f(x) = \begin{cases} 1 & \text{when } \sum w_i x_i + b \geq 0 \\ 0 & \text{else.} \end{cases}$$

$$\sigma(x) = \begin{cases} 1 & \text{when } x \geq 0 \\ -1 & \text{else.} \end{cases}$$

$$f(x) = \sigma(w^T x + b)$$





* Perceptron learning

  * Training data (x^i, y^i)

    Start with $k \leftarrow 1$ & $w_k = 0$

    while $\exists i \in \{1, 2 \cdots N\}$ such that $y_i (w^T \cdot x^i)_{\leq 0}$.

    $w_{k+1} = w_k + y^i x^i$

    $k++$

Gradient Descent.

good $f^{\wedge}$ f^* from F

find goodness of $f^{\wedge}$ f.

loss : $F \times L = R$.

l is increase with wrongness of f on z.

Possible loss $f^{\wedge}$:-

Regression

classification.

. . . .

f with small risk $R(f) = E_z(l(f,z))$

$f^* = \underset{f \in F}{\operatorname{argmin}} R(f)$

$\hat{R}(f:D) = \hat{E}_D(l(f,z)) = \frac{1}{N} \sum_{i=1}^{N} l(f, z_i)$.

$w^* = \underset{w}{\operatorname{argmin}} L(w)$ → optimize loss function.

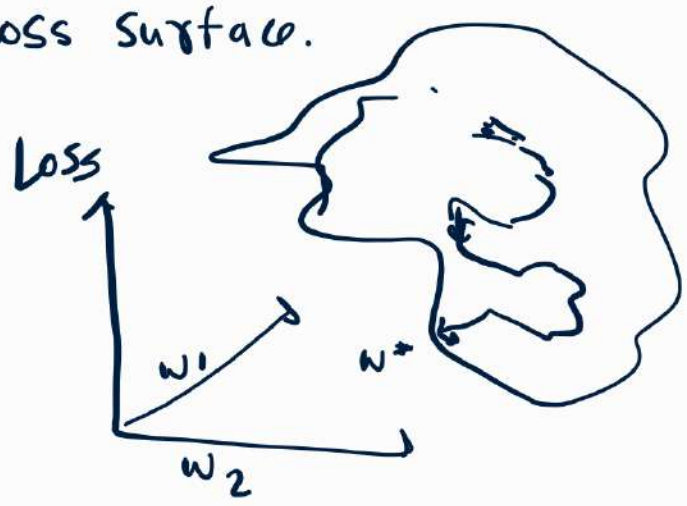
$w^* b^* = \underset{w,b}{\operatorname{argmin}} L(f(w,b), D)$

How to get optimal parameters.

linear regression.

Adhoc (kNN)

* Loss surface.



Probe random direction
Progress if you find useful direction
Repeat.

Optimal looking :-

Sense the slope around feet
Identify steepest dir^ & make brief progress
Repeat until convergence.
That is gradient descent.

Derivate of f^ at point gives rate of change of function at that point.

$$\frac{df}{dx} = \lim_{\delta \to 0} \frac{f(x+\delta) - f(x)}{\delta}.$$

$$\Delta f = \frac{\delta f}{\delta x} \Delta x.$$

$$f : R^D \to R.$$

$$\nabla f = R^D \to R^D \qquad x \to \left(\frac{\delta f}{\delta x_1} \cdots \frac{\delta f}{\delta x_D} \right)$$

* ∇f vector gives dir^n & rate of fastest increase for f.

$$\Delta f = \nabla f \cdot \Delta x. \quad (\text{dot product})$$

$$L(w+u) = L(w) + \nabla_w L(w) \cdot u + \frac{1}{2!} u^T \nabla^2 L(w) u \ldots$$

$$= L(w) + \nabla_w L(w) \cdot u.$$

for $L(w+u)$ lesser than $L(w)$. need $\nabla_w L(w) \cdot u$ so

Goal is minimize loss.

$$\frac{\delta f}{\delta x} = \lim_{\delta \to 0} \frac{+(x+\delta) - f(x)}{\delta}$$

* Batch Gr. descent.

for i in range (nb. epoch)

∇L_w = evaluate (grad. (L, D, V)

$w = w - \eta * \nabla L_V$.

Guarantee to converge global minima in case of convex fn & local minima in case of non convex function.

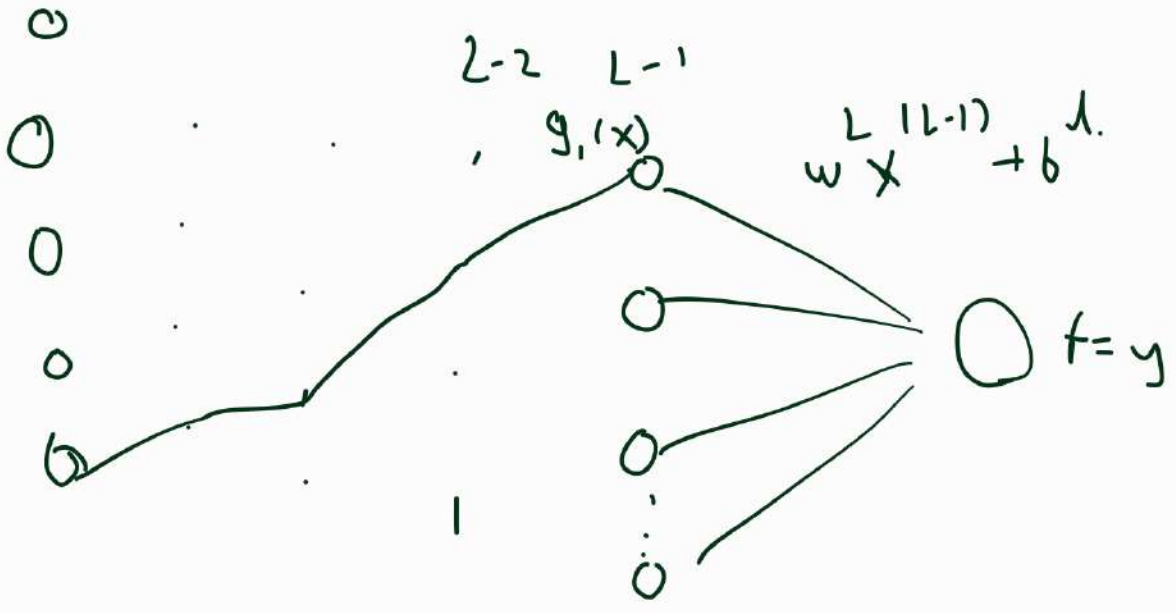
* Scohastic gradient descent.

$$w = w - \eta \nabla_w L(w, x^i, y^i)$$

* mini batch

$$w = w - \eta \nabla_w L(w, x^{i:i+n}, y^{i:i+n})$$

* Backpropagation



$$y = f(g_1(x)\ g_2(x), \cdots g_m(x))$$

$$\frac{dy}{dx} = \frac{df}{dg_1(x)} \frac{dg_1(x)}{dx} \cdots \frac{df}{dg_m(x)} \frac{dg_m(x)}{dx}$$

$$f(x) = e^{\sin(x^2)}$$

$$= e^{\sin(x^2)} \cdot \cos(x^2) \cdot 2x$$

Z1 11 12S

$$\frac{\delta l}{\delta s_i^{(l)}} = \frac{\delta x^{(l)}}{\delta s^{(l)}} \cdot \frac{\delta L}{\delta x^{(l)}}$$

$$x_i = \sigma(s_i)$$

$$= \frac{\delta L}{\delta x_i} \sigma'(s_i^{(l)})$$

$$s_i = \sum_j w_{ij}^{l} x_j^{l-1} + b_i^{(l)}$$

$$P(y_i|x) = \frac{e^{x_i}}{\sum_{i=1}^{N} e^{x_i}}$$ Softmax Non linearity.

$$X_i = \frac{e^{s_i}}{\sum_i^N e^{s_i}}$$

$$\frac{\delta x_i}{\delta s_j} = 0$$ for hidden layer

$i \neq j$

For softmax o/p layer this not valid.

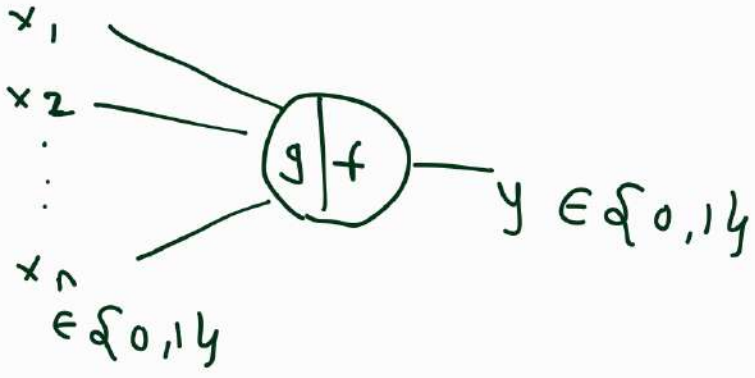
* NOTES FOR EXAM (24/11/25)

The Neuron.

Threshold Logic Unit → 1st Math. model for neuron.

MP neuron.

Boolean i/p.



$$f(x) = 1\left(\sum_i x_i \geq 0\right)$$

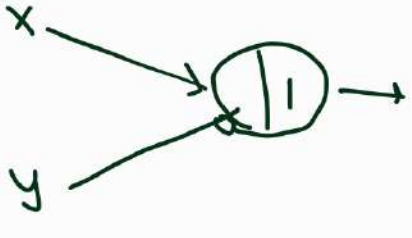
I/p can be excitatory & Inhibitory

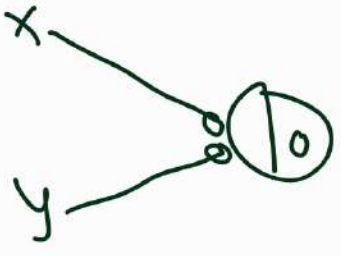
↑ more likely fire

↑ Reduce Likelihood.

- When Inhibitory i/p set (1) then o/p → 0
- Count no. of ON signals on exit. i/p vs Inhib.

* xy'





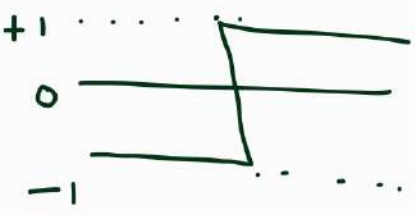
* Learn linear separation.
- No learning.

* Perceptron.

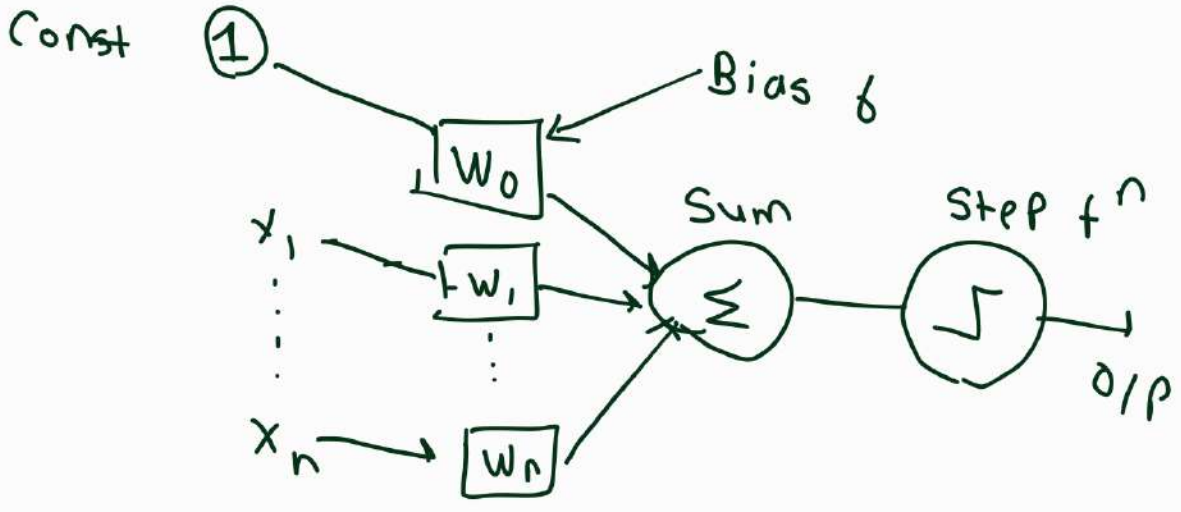
- Same like MP.
- Input can be real,
- weight can be diff. for diff. I/p.

$$f(x) = \begin{cases} 1 & \text{when } \sum_i w_i x_i + b \geq 0 \\ 0 & \text{else.} \end{cases}$$

- Sigmoid → $\begin{cases} 1 & \text{when } x \geq 0 \\ -1 & \text{else} \end{cases}$



- $f(x) = \sigma(w^T x + b)$ -- Activation function.
- Mechanism for learning weights.



- Training Data. $(x^i, y^i) \in \{-1, 1\}$.

  Start $k = 1$ & $w_k = 0$

  while $\exists\, i \in \{1 \cdots N\}$ s.t. $y^i (w_k^T \cdot x^i) \leq 0$.

  update $w_{k+1} = w_k + y^i x^i$

  $k \leftarrow k+1$.

- Bias can be appended with 1 suitably.

* Convergence Result.

- For linear sep. dataset algo converges after finite iterations.
- Stop as soon as find boundary.

* Perceptron learning code.

```
import torch.
D1 = torch.normal (0.0, 1.0, size [100,2])
D2 = torch.normal ( 3.0, 1.0, size=[100,2])
# Generate 100 data point from 2D with mean
(0 & 3) & S.D of 1 & store in D1, D2.
plt.scatter(D1[:,0], D1[:,1])
plt.scatter(D2[:,0], D2[:,1])
X = torch.empty(200, D1.size(1)+1), fill_(1))
X[::2,:2] = D1
X[1::2,:2] = D2
Print (X.shape)
y= torch.empty(200,1)
y[::2,:2] = 1.0
y[1::2,:2] = -1.0
Print(y.shape)
#  [200,3]  [200,1]
   Create X with (200,3) fill with 1
   Store i/p for perceptron.
   Extra Dim for Bias.
```

Even row D_1 } Assign.
Odd row D_2 }

y empty → labels.

even → 1.

odd → -1.

```
w = torch.zeros(X.size(1)).  --initialize w by 0.
def trainperceptron(x, y, w, epoch)
    for e in range(epoch)
        change = 0
        for (i = 0 → X.size(0))
            if X[i].dot(w) * y[i] <= 0 ··wx+b不c
                w = w + y[i] * X[i]        w = w + xy.
                change = change + 1
        if change == 0
            break # early stop.
    Print(no. of changes., change).
    return w.

w = train_perceptron(x, y, w, 5)
Print(w)
```

* DL-2.

Linear classifiers.

Sometime data is linearly seperable
Some time not
Some time specific preprocessing can make it seperable.

In XOR.

$$\phi(x) = \phi(x_u, x_v) = (x_u, x_v, x_u x_v)$$

- make new dimension then you found the seperable plane.
- Increasing dimension (degree) increase capacity.
- Reduce Bias increase capacity.
- Preprocessing is also may way to reduce capacity.

XOR:.

x_1	x_2	XOR
0	0	0
0	1	1
1	0	1
1	1	0

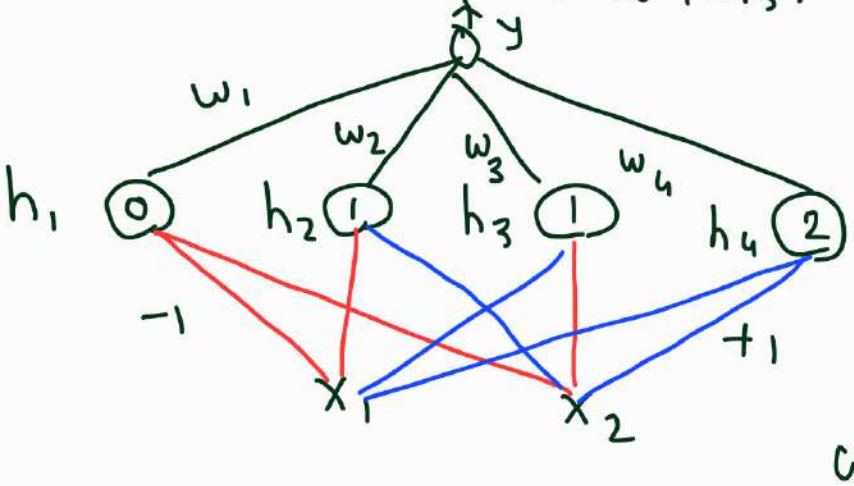
$w_0 < 0$

$w_2 + w_0 \geq 0 = w_2 \geq -w_0$

$w_1 + w_0 \geq 0 = w_1 \geq -w_0$

$w_1 + w_2 + w_0 < 0 = w_1 + w_2 < -w_0$

Single perceptron can't do this.



$w_1\ w_2\ w_3\ w_4$

$(0,0) = (-1)\,0 + (+1)\cdot 0$

$= (h_1 = 0)\quad h_2 = 0 \quad h_3 = 0 \quad h_4 = 0$

$(0,1) = -1, (1), -1, 1$

↑ this fire.

x_1	x_2	h_1	h_2	h_3	h_4	y	XOR
0	0	1	0	0	0	$w_1 + w_0$	0
0	1	0	1	0	0	$w_2 + w_0$	1
1	0	0	0	1	0	$w_3 + w_0$	1
1	1	0	0	0	1	$w_4 + w_0$	0

$w_1 < -w_0 \quad w_2 \not< -w_0 \quad w_3 \not< -w_0$

$w_4 < -w_0$

Possible Find this weights

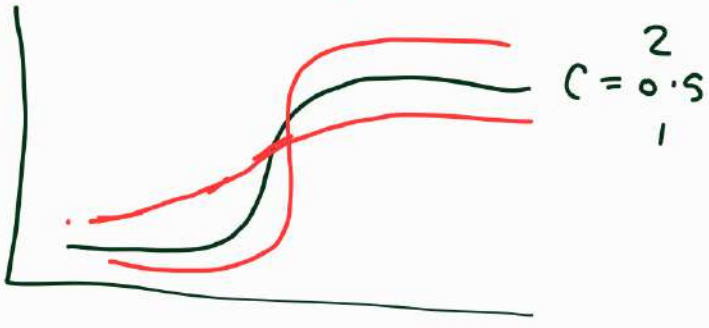
* other 2 i/p boolean f^n.

- can possible with 2^n perceptron in hidden layer & 1 in o/p. layer.
- $2^n + 1$ is sufficient but not necessary
- MLP (multi layer N/w of perceptron)

* Many real world problem have non-binary o/p. Perceptron only gives 2 o/p.

* Sigmoid neuron.

$$f(x) = \frac{1}{1 + e^{-w^T x}}$$



* Any Boolean function with n i/p represent with one hidden layer.

-We can represent any continuous f^n to any approximation with linear comb. of sigmoid neurons.

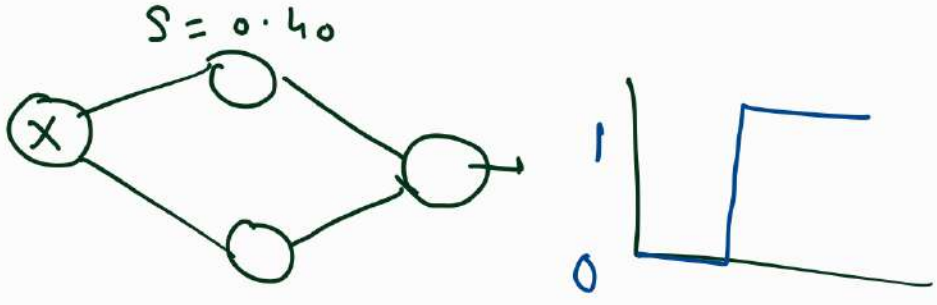
- Neural n/w with single hidden layer used to approx any cont. f^n to any desired precision.
- Using K map we can have 2^{N-1} perc. in hidden layer.
- $3(N-1)$ required in deep N/w. Linear in N. arranged in $2\log_2(N)$ layers.

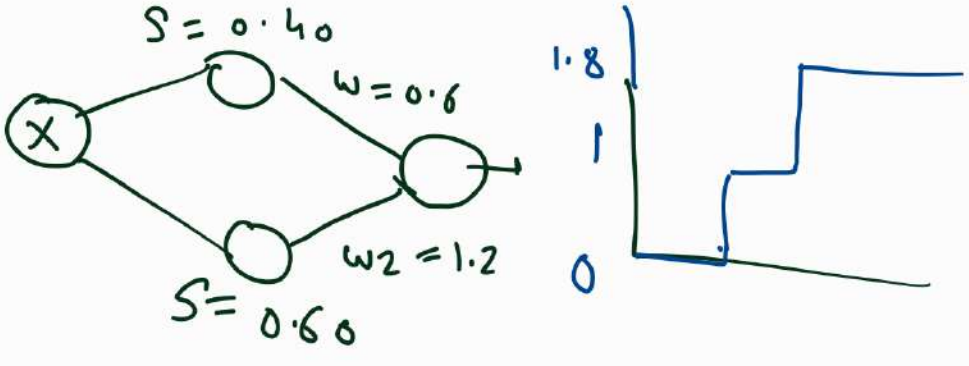
* DL-03

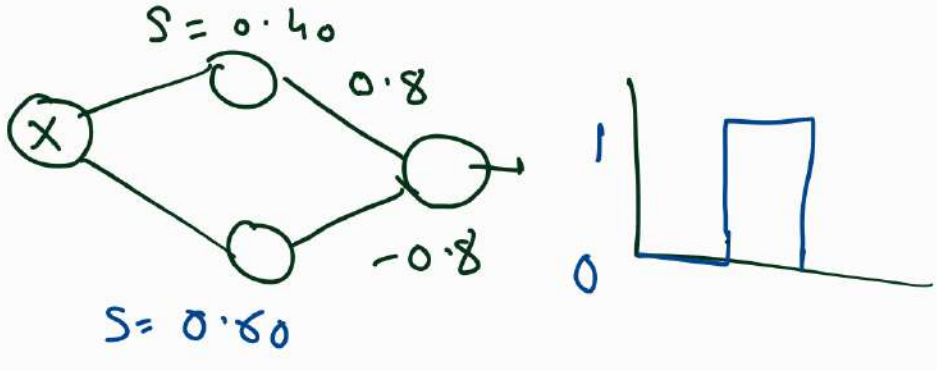
* Uniform Approximation Th^m.

Using simple model (with 1 hidden layer) you can approximate any continuous function as closely as you want.

- Sigmoid neuron is taken i/p & process & produce o/p like S curve.
- NN with one hidden layer can fit any continuous function.



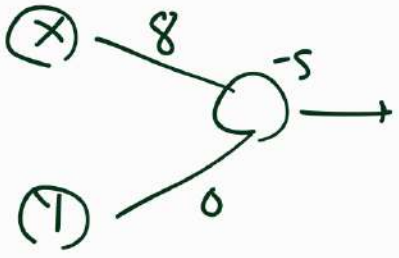


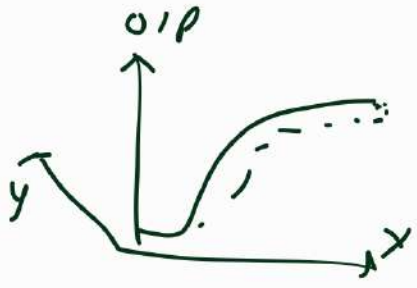


We only computed weighted sum of hidden outputs.

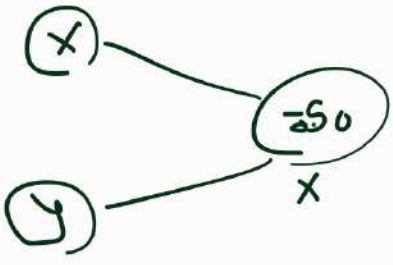
* when multiple inputs are introduced

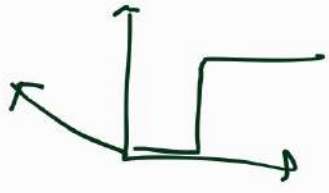
when 2 i/p we get 3 D plane.

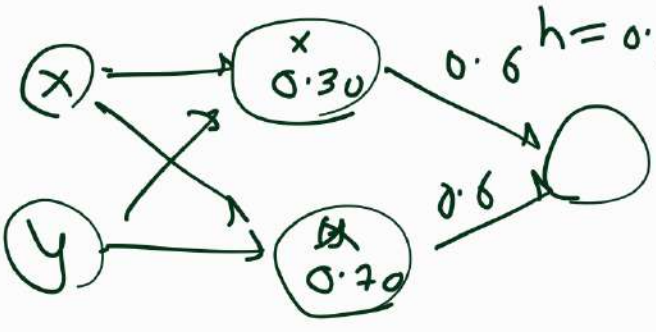


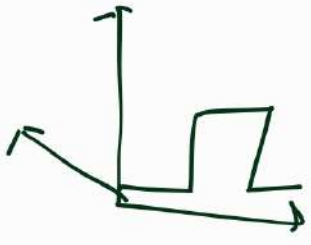


$$S = \frac{-b}{w}$$

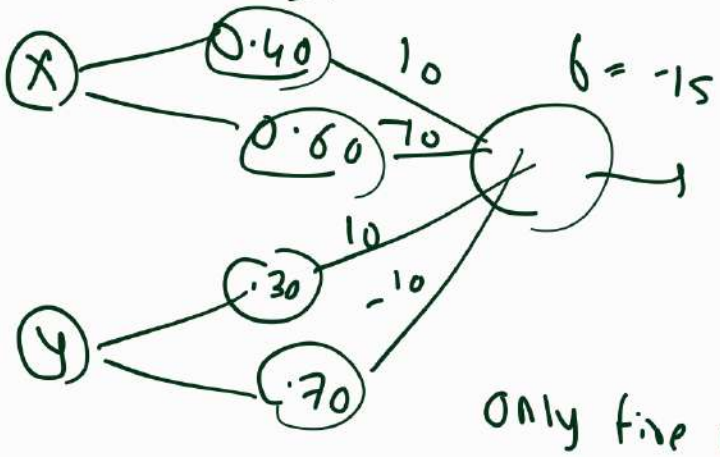


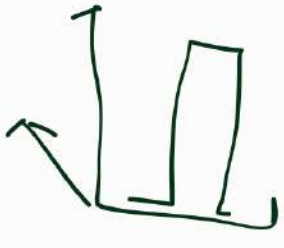






* Towers in 3D.





only fire when above is

0.40 → 0.60

* Target f^ lie on space other than hypercube.
Discontinued target can be approximately arbitrary well
σ is general as non poly f^

* If one layer is good then why we need deep N/w
- may require infeaseble size for hidden layer.
- May not generalize well.
- Not enable hierarchical learning.

* DL-4

Learning → Finding f^* from F.
- For good function we use Loss.
- $l : F \times Z \to R$.
- Such that value $l(f,z)$ increases with wrong of f on z. (diff. bet^n expected & predicted)
- Regression : $l(f,(x,y)) = (f(x) - y)^2$
  classification : $l(f,(x,y)) = 1(f(x) \neq y)$
  Density est. : $l(q,z) = -\log(q(z))$
- we want f with expected risk $R(f) = E_z(l(f,z))$
- $f^* = \underset{f \in F}{\operatorname{argmin}}\ R(f)$
- Emperical Risk.

$$\hat{R}(f;D) = \hat{E}_D(l(f,z)) = \frac{1}{N}\sum_{i=1}^{N} l(f,z_n)$$

- model param. that minimize loss f^n.

$$w^* = \underset{w}{\operatorname{argmin}}\ L(w)$$

- $W^* \, b^* = \underset{W,b}{\operatorname{argmin}} \, L(f(\cdot; W, b); D)$

- How to find optimal parameters.
  - close from solution. (linear Reg.)
  - Ad hoc recipes (perceptron, kNN classifier)

* How to find minimum loss surface.
  - Probe random directions
  - Progress if you find useful direction
  - Repeat.
  - Ineffective.

Better :- Follow the slope.
  - Sense the slope around feet.
  - Identify stiffest dir^n, make brief progress
  - Repeat.
  - GRADIENT DESCENT.

* Derivative of f^n at given point gives rate of change of f^n at that point.

$$\frac{df}{dx} = \lim_{\delta \to 0} \frac{f(x+\delta) - f(x)}{}$$

$$\Delta f = \frac{\partial f}{\partial x} \Delta x$$

in higher dimensions

$$\nabla f : R^D \to R^D$$

$$x \to \left(\frac{\partial f}{\partial x_1} \cdots \frac{\partial f}{\partial x_D} \right)$$ -- gives dir^n & rate of inc. for f.

$$\Delta f = \nabla f \cdot \Delta x.$$

$$L(w+u) = L(w) + \nabla_w L(w) \cdot u$$

To minimize loss $(L(w+u) < L(w))$

$$\nabla_w L(w) \cdot u < 0.$$

- diff. would be less if u is in opp. dirⁿ of $\nabla_w L(w)$, the gradient.

$L(w)$ → loss at w

$\nabla_w L(w)$ → gradient of loss at w.

u → step

$\nabla^2 L(w)$ → Hessian matrix (2^{nd} dev.)

* GRADIENT DESCENT

- Goal to minimize the error.
- Determine parameter w that minimize $L(w)$
- Gradient points uphill → −ve of grad. points downhill.

* Start with arbitrary initial parameter w_0.
- Repeatedly modify it via updating in small steps
- At each step modify dirⁿ that produce steepest descent along with error

* Numerically for each w.

$$\frac{\delta f}{\delta x} = \lim_{\delta \to 0} \frac{f(x+\delta) - f(x)}{\delta}$$

Slow & approximate.

* Analytical methods.

- we use this as numerical method is slow & approx
- Analytical is exact & precise (calculas) use to calculation in backprop.

$$L_i = \sum_{j \neq y_i} \max(0, s_j - s_{y_i} + 1) \rightarrow \text{hinge loss}$$

$$L = \frac{1}{N} \sum_i L_i + \sum_k W_k^2 \rightarrow \text{Reg. loss}$$

$$s = f(x, W)$$

$$\nabla L_{iw} = \nabla \text{Hingeloss} + \nabla \text{Regularization}.$$

$$\begin{cases} \frac{\delta s_j}{\delta w} - \frac{\delta s_{y_i}}{\delta w} + 2\lambda W. & \text{if } s_j - s_{y_i} + 1 > 0 \\ 0 + 2\lambda W. & \text{otherwise} \end{cases}$$

* Batch Gradient descent.

```
for i in range (nb_epoch):
    ∇Lw = evaluate_gradient (L, D, w)
    w = w - η * ∇Lw
```

- If terms of convex function you guaranteed get global minima.

* Stochastic Gra. De.

weight update parameter for each training example

$$w = w - \eta \nabla_w L(w, x^i, y^i)$$

- In case of large DS Batch GD compute redundant gradients for similar example.
- SGD does away with redundancy & faster can be used to learn online.
- Frequent updates with high variance cause objective f^ to fluctuate heavily.
- SGD fluctuation enable it to jump new & better local minima.
- Complicate convergence.

```
for i in range(ep_epoch)
    np.random.shuffle(D)
    for Xi ∈ D
        ∇Lw = evaluate gradient(L, Xi, w)
        w = w - η * ∇Lw.
```

* MiniBatch Gra. De.

Best of both & update param every mini batch.

$$w = w - \eta \nabla_w \mathcal{L}(w, x^{i:i+n}, y^{i:i+n})$$

Reduce variance # param. updates

used highly optimized matrix optimization.

Batch size 32 → 1024.

```
for i in range (nb epoch)
    np.random.shuffle(D)
    for batch in get batches (D, batchsize=128)
        ∇w = evaluate gradient (L, batch, w)
        w = w − η * ∇w.
```

* Some challanges
  - choose proper learning rate
  - make learning rate applies to all param.
  - Avoid numerous sub-optimal local minima.

* DL-5

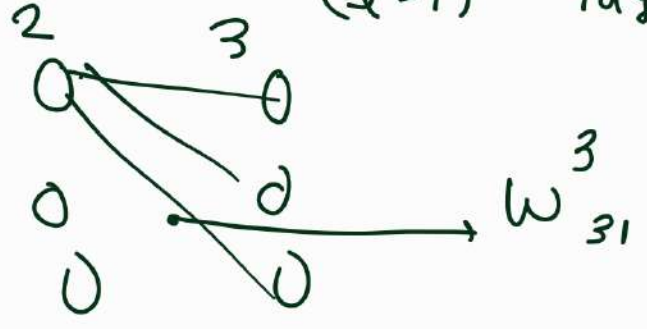
Gradient of scaler fⁿ $f(x) = x \to \left(\frac{\partial f}{\partial x_1} \cdots \frac{\partial f}{\partial y_n} \right)^T$.

Gradient of vector valued fⁿ called Jac.

$$J = \begin{bmatrix} \frac{\partial f}{\partial x_1} & \cdots & \frac{\partial f}{\partial x_n} \end{bmatrix} = \begin{bmatrix} \nabla^T f_1 \\ \vdots \\ \nabla^T f_m \end{bmatrix} = \begin{bmatrix} \frac{\partial f_1}{\partial x_1} & \cdots & \frac{\partial f_1}{\partial x_n} \\ \vdots & & \\ \frac{\partial f_m}{\partial x_1} & \cdots & \frac{\partial f_m}{\partial x_n} \end{bmatrix}$$

w^l_{jk}.

connecting j^{th} neuron in l^{th} layer & k^{th} neuron in $(l-1)^{th}$ layer.



b^l_j bias of j^{th} neuron in l^{th} layer.

x^l_j op of j^{th} neuron in l^{th} layer.

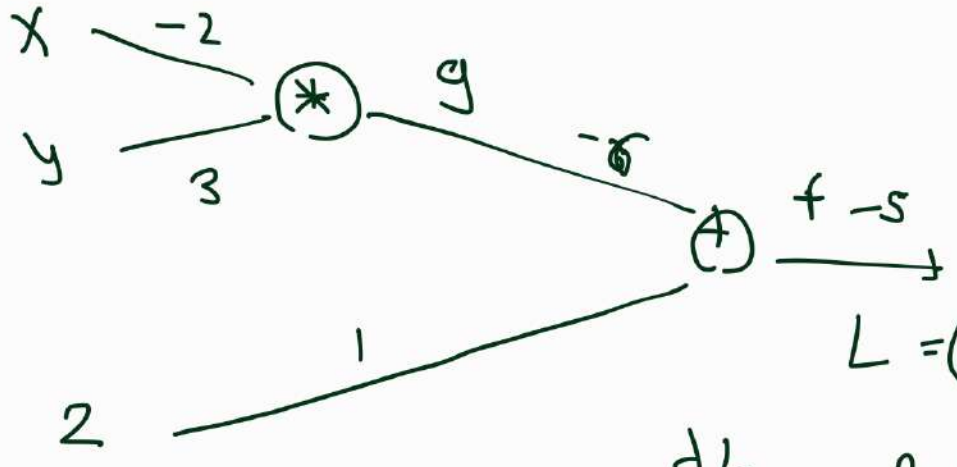
$$\Delta y = \left(\frac{df}{dg_1(x)} \frac{dg_1(x)}{dx} \cdots \right) \Delta x.$$



$g = xy$

$f = g + z.$

$f(x, y, z) = xy + z$

$L = (f - t)^2.$ ($t = -4$ for this)

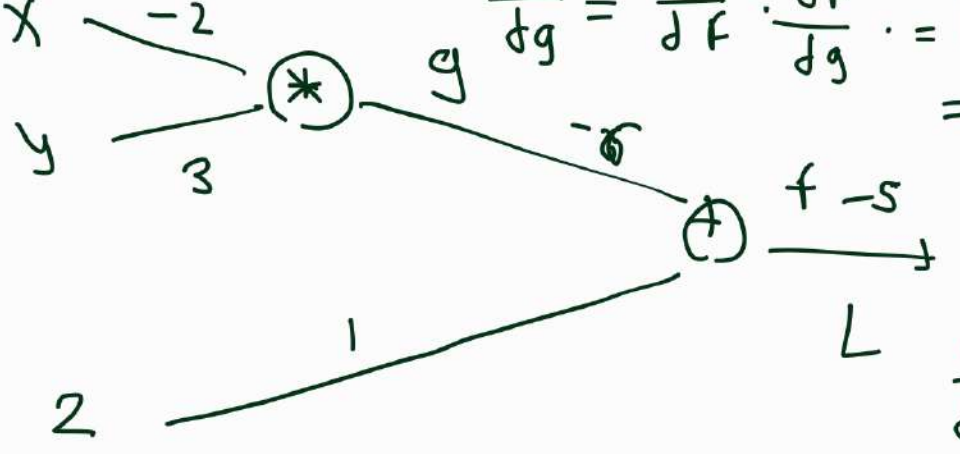
$\frac{dL}{df} = 2(f - t)$

$= -2$

$f = g + z.$

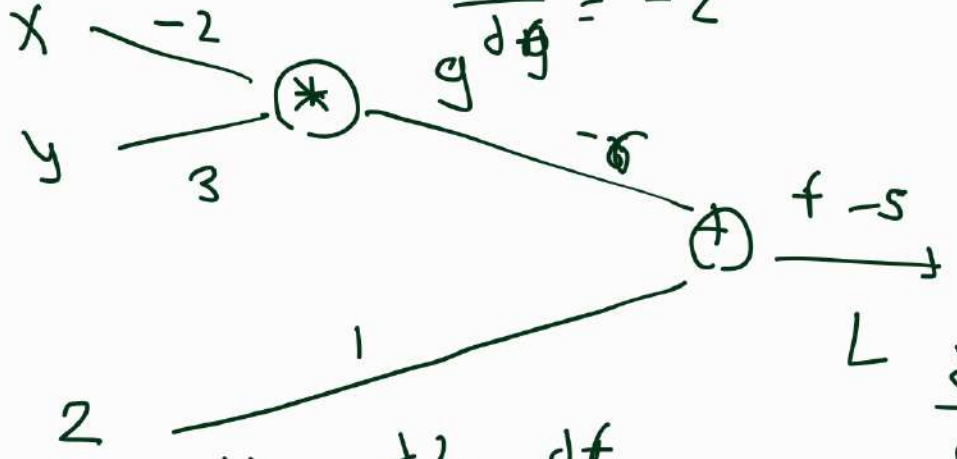
$\frac{dL}{dg} = \frac{dL}{df} \cdot \frac{df}{dg} \cdot = (-2) * 1$

$= -2$



$L \quad \frac{dL}{df} = -2$

$\frac{dL}{dg} = -2$



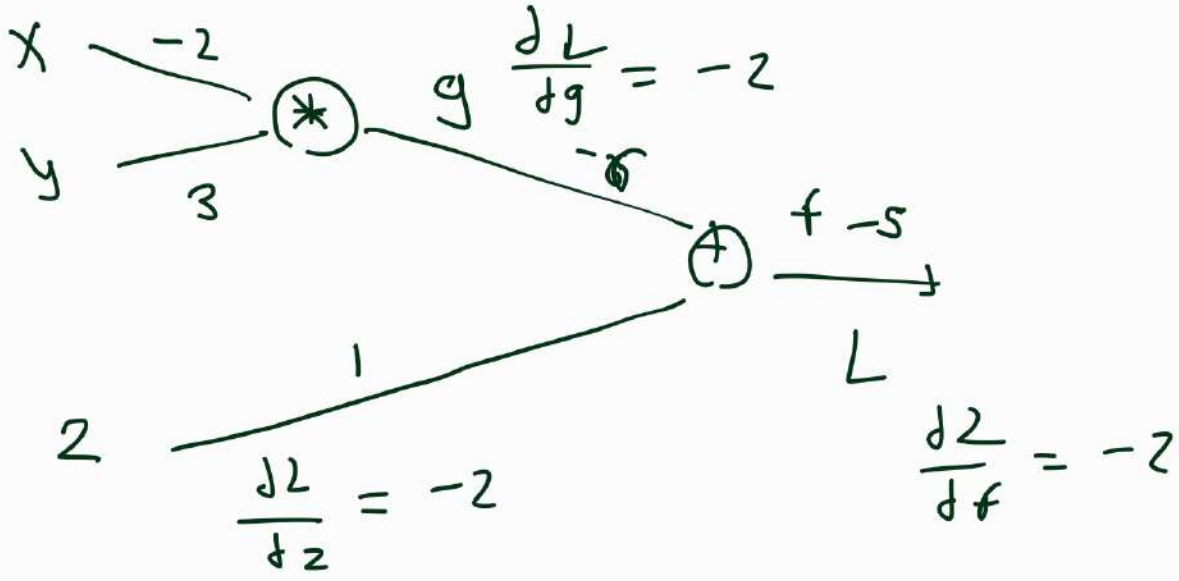
$L \quad \frac{dL}{df} = -2$

$\frac{dL}{dz} = \frac{dL}{df} \cdot \frac{df}{dz}.$

$= (-2) * 1$

$= \underline{\underline{-2}}$

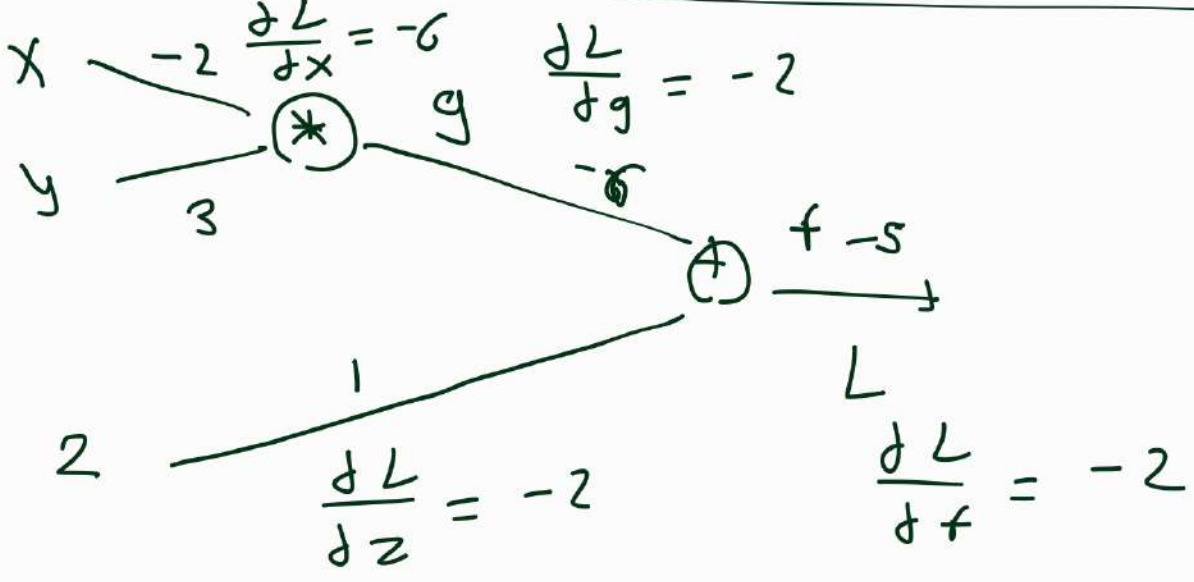
$f = g + z$



$$\frac{dL}{dx} = \frac{dL}{dg} \cdot \frac{dg}{dx} \qquad g = xy$$

$$= (-2) * y$$

$$= (-6) \quad -(y = 3)$$



$$\frac{dL}{dy} = \frac{dL}{dg} \cdot \frac{dg}{dy}$$

$$= (-2) * x$$

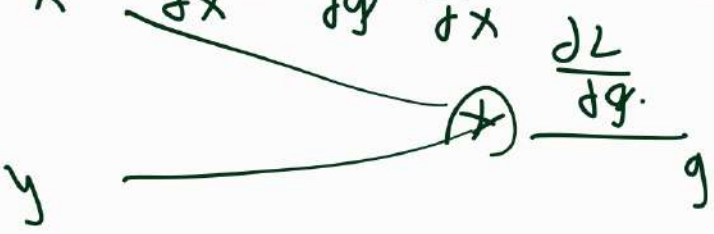
$$= \underline{\underline{4}}$$

* Gradient Flow

Down stream grad. x → $\frac{dL}{dx} = \frac{dL}{dg}\frac{dg}{dx}$ → local

↓ Upstream → as we take from forward pass

we calculate locally



$$J_{f_N \circ f_{N-1} \circ \cdots f_1(x)} = J_{f_N}(f_{N-1}(\cdots f_1(x))) \cdot J_{f_{(N-1)}} \cdots (f_{N-2} \cdots f_1(x)) \cdots J_{f_1(x)}$$

$J_{f(x)}$ is Jacobian of f computed at x.

* Backpropogation.

Take any layer.

$$x^{(l-1)} \xrightarrow{w^{(l)}, b^{(l)}} s_i^l \xrightarrow{\sigma} x^l$$

$$x_i^l = \sigma(s_i^l)$$

s^l influence loss $\mathcal{L}$ through $x^{(l)}$ only.

$$\frac{\delta l}{\delta s_i^{(l)}} = \frac{\delta l}{\delta x_i^{(l)}} \cdot \frac{\delta x_i^{(l)}}{\delta s_i^{(l)}}$$

$$= \frac{\delta l}{\delta x_i^{(l)}} \sigma'(s_i^l)$$

$$s_i^{(l)} = \sum_j W_{ij}^{(l)} x_j^{(l-1)} + b_i^{(l)}$$

Since x^{-1} influence loss $\mathcal{L}$ only through $s^{(l)}$

$$\frac{\delta l}{\delta x_j^{(l-1)}} = \sum_i \frac{\delta l}{\delta s_i^{(l)}} \cdot \frac{\delta s_i^{(l)}}{\delta x_j^{(l-1)}}$$

$$= \sum_i \frac{\delta l}{\delta s_i^{(l)}} \cdot W_{ij}^{(l)}$$

→ δ of $(Wx+b)$ is W.

w^l & b^l influence loss via s^l.

$$s_i^{(l)} = \sum_j W_{ij}^{(l)} x_j^{(l-1)} + b_i^{(l)}$$

$$\frac{\delta l}{\delta w_{ij}^{(l)}} = \frac{\delta l}{\delta s_i^{(l)}} \cdot \frac{\delta s_i^l}{\delta w_{ij}^l} = \frac{\delta l}{\delta s_i^l} \cdot x_j^{(l-1)}$$

$$\frac{\partial l}{\partial b_i^{(l)}} = \frac{\partial l}{\partial s_i^l} \frac{\partial s_i^{(l)}}{\partial b_i^{(l)}} = \frac{\partial l}{\partial s_i^{(l)}}$$

* From defination of loss obtain $\frac{\partial l}{\partial x_i^{(l)}}$

Recursively compute loss dev. wrt activations.

$$\left.\begin{aligned} \frac{\partial l}{\partial s_i^{(l)}} &= \frac{\partial l}{\partial x_i^l} \sigma'(s_i^l) \\ \frac{\partial l}{\partial x_j^{(l-1)}} &= \sum_i \frac{\partial l}{\partial s_i^l} \cdot w_{ij}^l \end{aligned}\right\} \text{Gradient}$$

then wrt parameters.

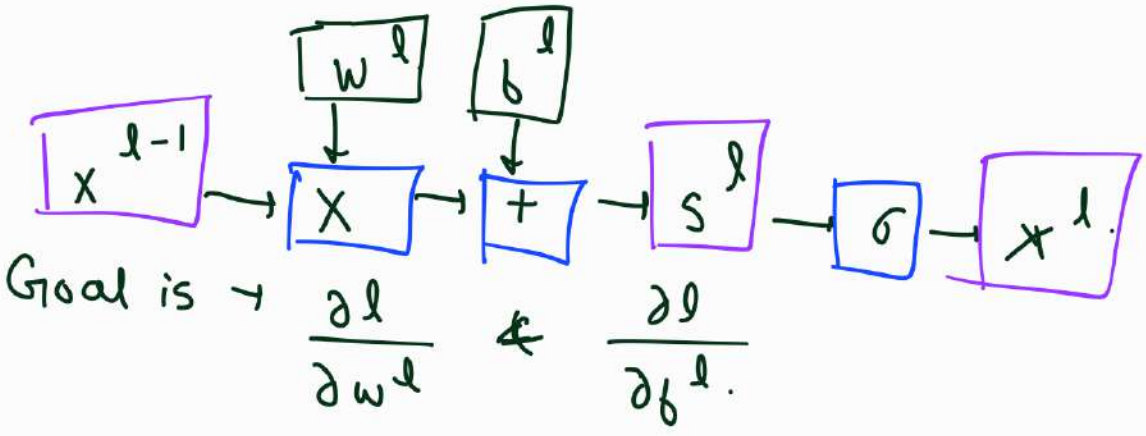
$$\left.\begin{aligned} \frac{\partial l}{\partial w_{ij}^l} &= \frac{\partial l}{\partial s_i^l} \cdot x_j^{(l-1)} \\ \frac{\partial l}{\partial b_i^l} &= \frac{\partial l}{\partial s_i^l} \end{aligned}\right\} \text{Param.}$$

* Jacobian in Tensorial Form.

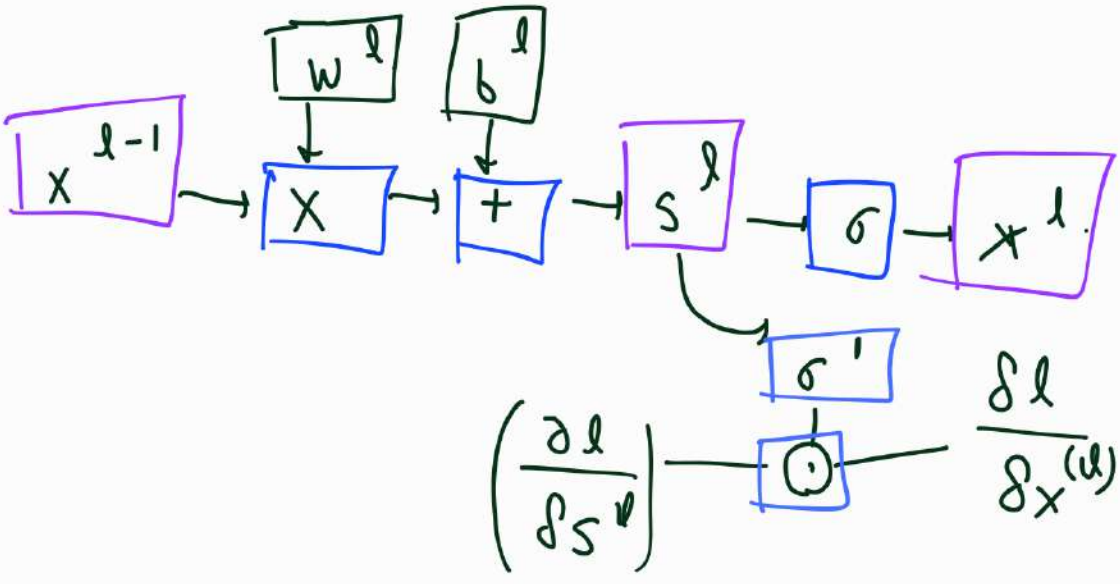
$\psi : R^N \to R^m$ then $\left[\frac{\partial \psi}{\partial x}\right] = \begin{bmatrix} \frac{\partial \psi_1}{\partial x_1} & \cdots & \frac{\partial \psi_1}{\partial x_N} \\ \vdots & \ddots & \vdots \\ \frac{\partial \psi_M}{\partial x_1} & \cdots & \frac{\partial \psi_M}{\partial x_N} \end{bmatrix}$

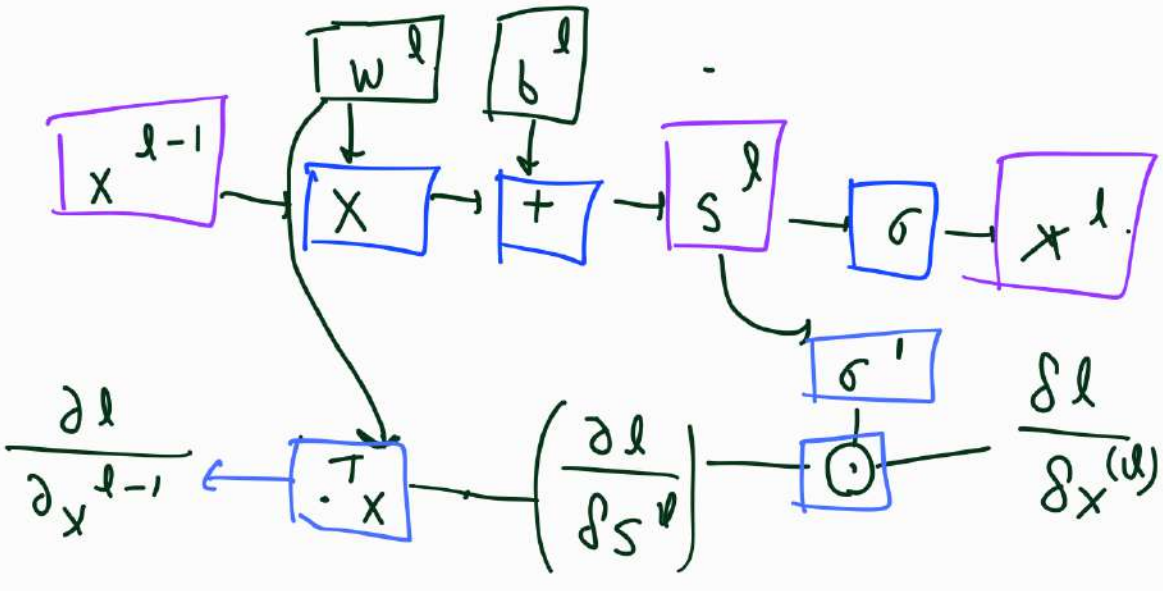
$\psi R^{N \times m} \to R$ then $\left[\left[\frac{\partial \psi}{\partial x}\right]\right] = \begin{bmatrix} \frac{\partial \psi}{\partial w_{11}} & \cdots & \frac{\partial \psi}{\partial w_{1,M}} \\ \vdots & & \vdots \\ \frac{\partial \psi}{\partial w_{N,1}} & \cdots & \frac{\partial \psi}{\partial w_{NM}} \end{bmatrix}$

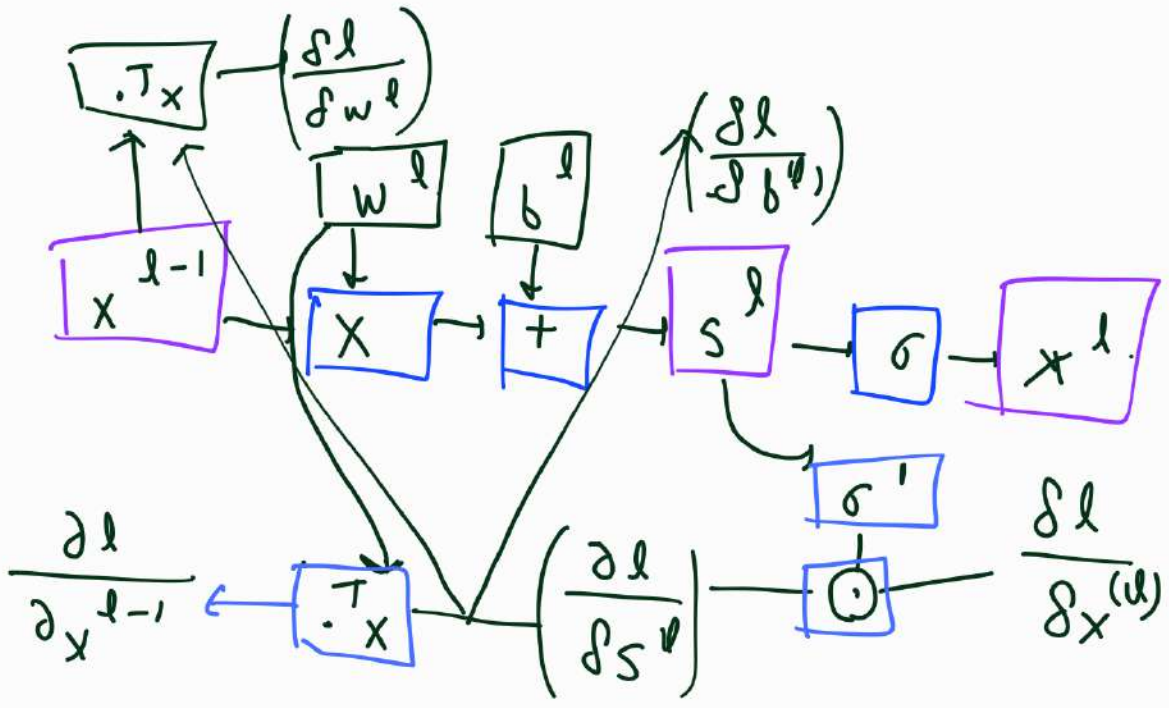
* Forward pass



Goal is → $\frac{\partial l}{\partial w^l}$ & $\frac{\partial l}{\partial b^l}$.





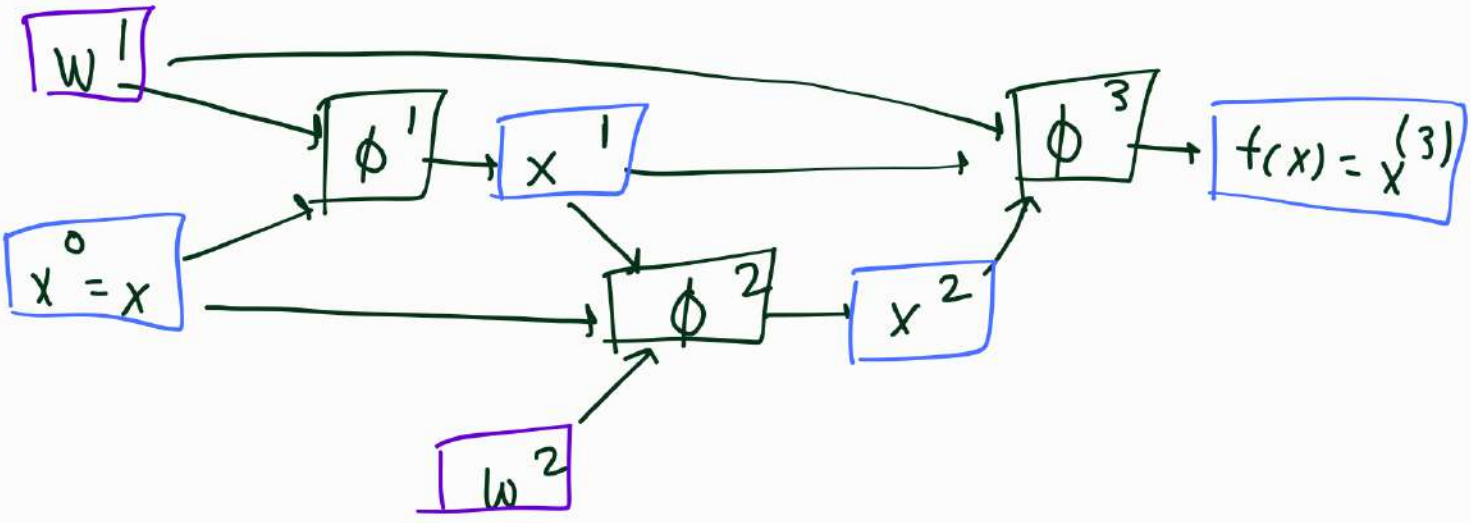


update params

$$w^l = w^l - \eta\left[\left[\frac{\partial l}{\partial w^l}\right]\right] \quad \& \quad b^l = b^l - \eta\left[\frac{\partial l}{\partial b^l}\right)$$

BP is applying chain rule iteratively.
Expressed in tensorial form
Heavy computation with linear ops.
Non-lin. goes with simple element wise ops.
BP needs all int. layer result to be in memory
Take twice the computations of Fw pass.

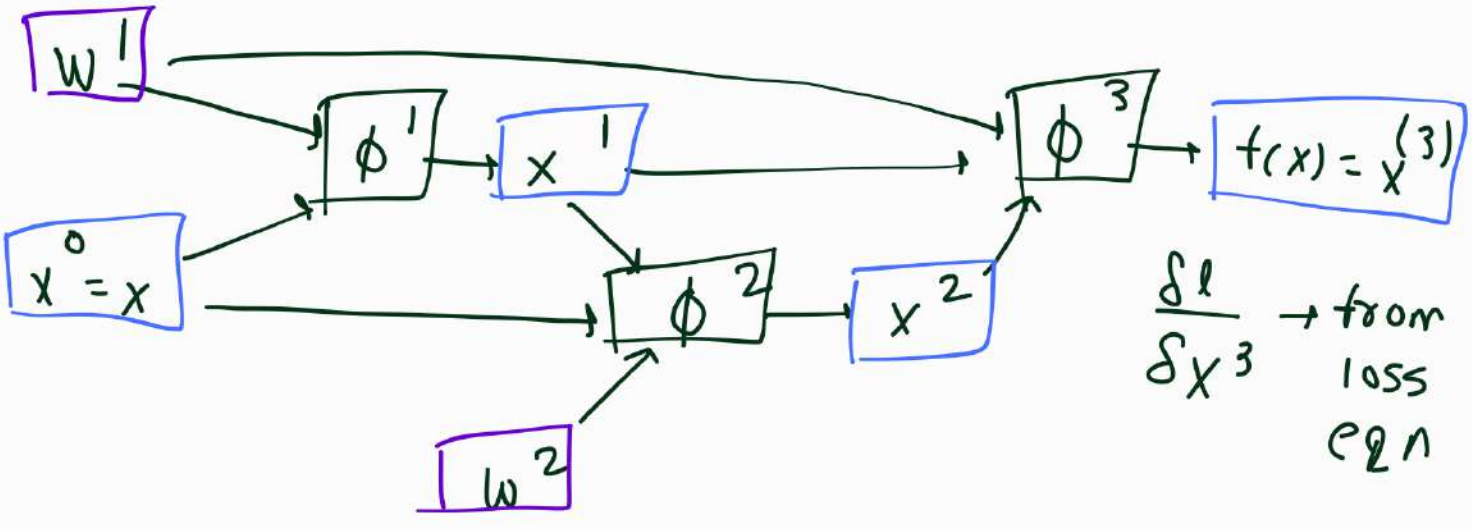
* For an Example.

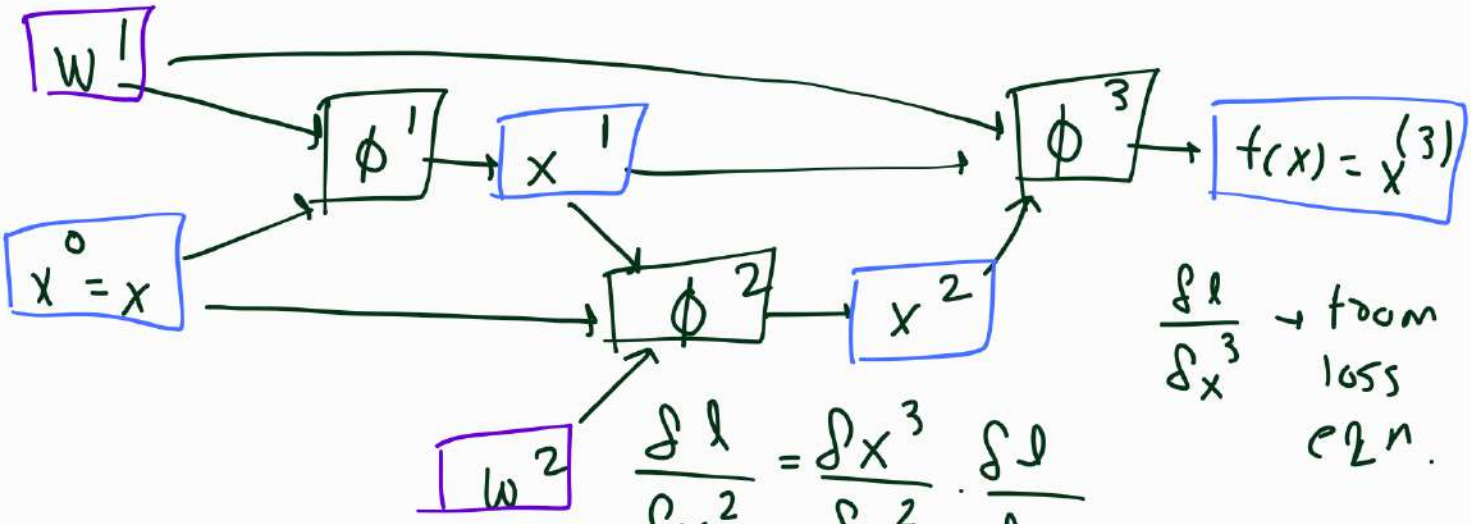


Forward pass

$$x^0 = x$$
$$x^1 = \phi^1(x^0 . w^1)$$
$$x^2 = \phi^2(x^0, x^1, w^2)$$
$$x^3 = \phi^3(x^1, x^2, w^1)$$

* Back propogation.





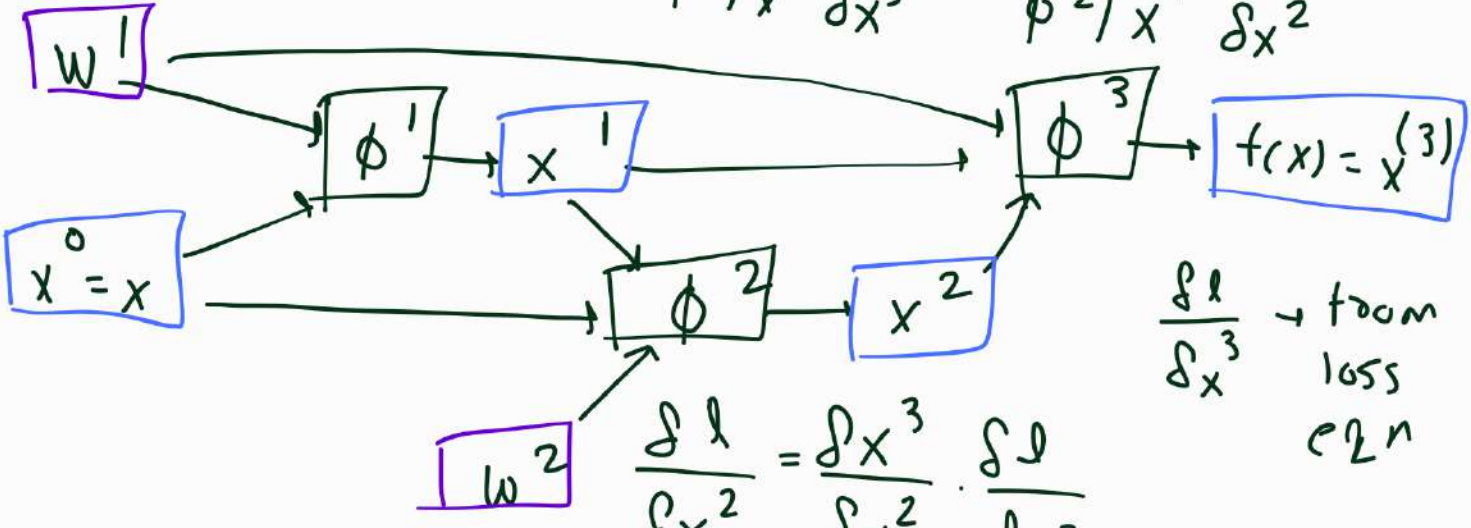
$\frac{\partial l}{\partial x^3}$ → from loss eqn.

$$\frac{\partial l}{\partial x^2} = \frac{\partial x^3}{\partial x^2} \cdot \frac{\partial l}{\partial x^3}$$

$$= J^T_{\phi^3/x^2} \cdot \frac{\partial l}{\partial x^3}$$

$$\frac{\partial l}{\partial x^1} = \frac{\partial x^3}{\partial x^1} \cdot \frac{\partial l}{\partial x^3} + \frac{\partial x^2}{\partial x^1} \cdot \frac{\partial l}{\partial x^2}$$

$$= J^T_{\phi^3/x^1} \frac{dl}{dx^3} + J^T_{\phi^2/x^1} \cdot \frac{\partial l}{\partial x^2}$$



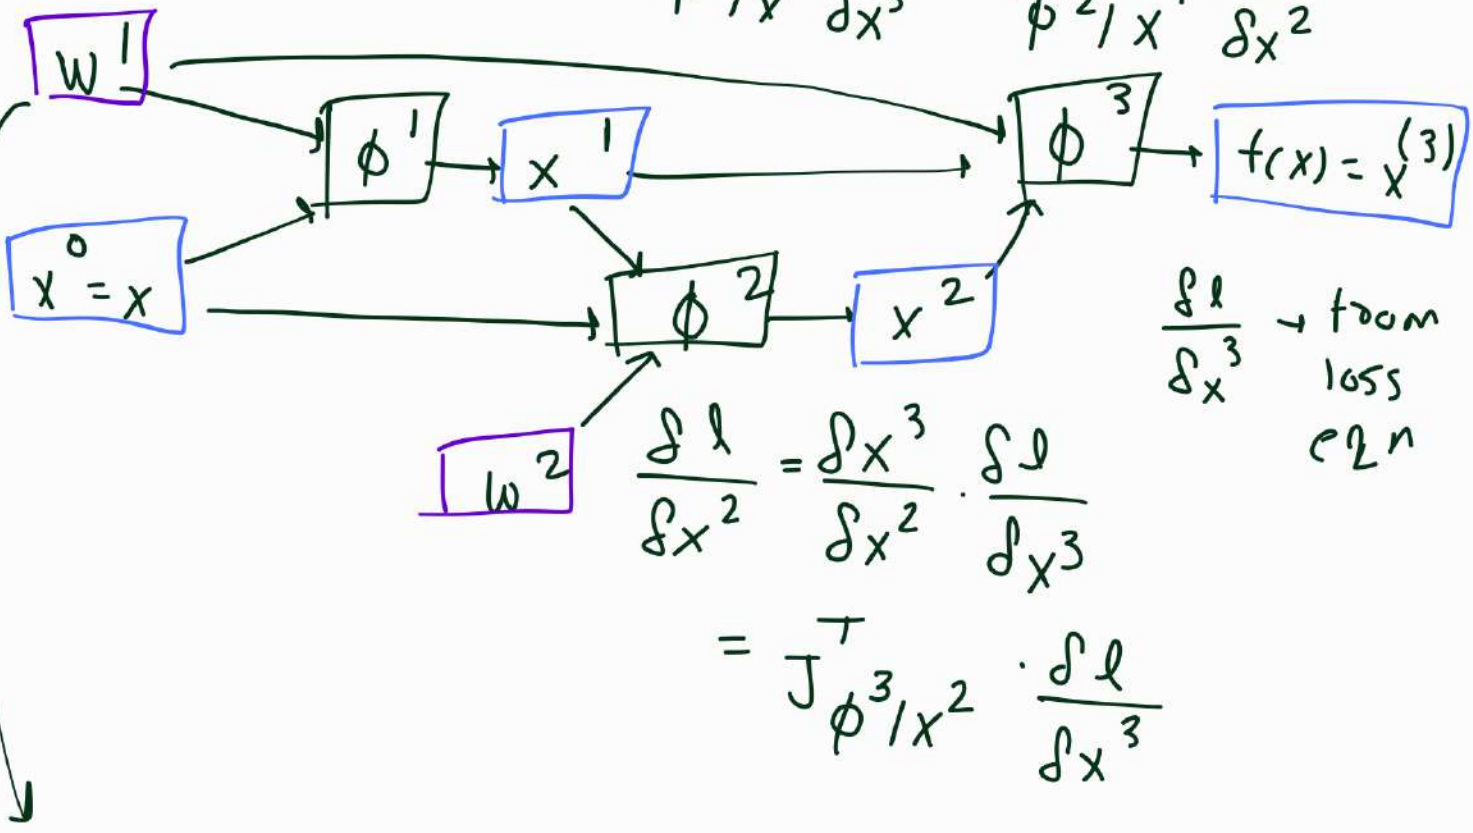
$\frac{\partial l}{\partial x^3}$ → from loss eqn

$$\frac{\partial l}{\partial x^2} = \frac{\partial x^3}{\partial x^2} \cdot \frac{\partial l}{\partial x^3}$$

$$= J^T_{\phi^3/x^2} \cdot \frac{\partial l}{\partial x^3}$$

$$\frac{\delta l}{\delta x^1} = \frac{\delta x^3}{\delta x^1} \cdot \frac{\delta l}{\delta x^3} + \frac{\delta x^2}{\delta x^1} \cdot \frac{\delta l}{\delta x^2}$$

$$= J^T_{\phi^3/x^1} \frac{dl}{dx^3} + J^T_{\phi^2/x^1} \cdot \frac{\delta l}{\delta x^2}$$



$\frac{\delta l}{\delta x^3}$ → from loss eqn

$$\frac{\delta l}{\delta x^2} = \frac{\delta x^3}{\delta x^2} \cdot \frac{\delta l}{\delta x^3}$$

$$= J^T_{\phi^3/x^2} \cdot \frac{\delta l}{\delta x^3}$$

$$\frac{\delta l}{\delta w^1} = \frac{\delta x^3}{\delta w^1} \cdot \frac{\delta l}{\delta x^3} + \frac{\delta x^1}{\delta w^1} \cdot \frac{\delta l}{\delta x^1}$$

$$= J^T_{\phi^3/w^1} \left(\frac{\delta l}{\delta x^3} \right) + J^T_{\phi^1/w^1} \left(\frac{\delta l}{\delta x^1} \right)$$

$$\frac{\delta l}{\delta w^2} = \frac{\delta x^2}{\delta w^2} \frac{\delta l}{\delta x^2} = J^T_{\phi^2/w^2} \left(\frac{\partial l}{\delta x^2} \right)$$

New training samples may change BP minimally
Prefers consistency (low variance) over perfection (low bias)
minimizing proxy may not minimize actual.

- Saddle points are more frequent than local minima.
- Most local minima are equivalent & close to global minima.
